The North Central Climate Adaptation Science Center (NC CASC) is a partnership between the US Geological Survey, the University of Colorado Boulder and five consortium partners. The NC CASC fosters innovative and applied research in support of tribal, federal, state, and local natural resource management and decision-making.

The North Central center is one of eight regional climate centers in the national CASC network created to help meet the changing needs of land and resource managers across the country. It serves Colorado, Wyoming, Montana, North Dakota, South Dakota, Kansas and Nebraska. The NC CASC supports and produces science that informs climate adaptation planning in regards to fish and wildlife, water, agriculture, and wildfire mitigation.

The NC CASC is committed to working with Tribal partners to create usable and relevant science to build resilience to anthropogenic climate change. The NC CASC recognizes the importance and value of Indigenous knowledge in addressing environmental challenges and any tribal projects funded through NC CASC follow the Guidelines for Considering Indigenous Knowledges in Climate Change Initiatives to ensure data sovereignty and best practices for working with sovereign Tribal Nations.
